

## Patching Continuous fns :

If  $f$  &  $g$  are equal on  $A \cap B$ ,  
then  $f$  &  $g$  can be "pasted" to  
make a contin. fcn on  $A \cup B$ .

$$h(x) = \begin{cases} f(x) & \text{if } x \in A \\ g(x) & \text{if } x \in B \end{cases}$$

$A$  &  $B$  must be closed:

these can't be  
pasted together.

Thm (Pasting Lemma) Let  $X$  &  $Y$  be top. spaces,  
let  $X = A \cup B$  where  $A$  &  $B$  are both closed.

Let  $f: A \rightarrow Y$  &  $g: B \rightarrow Y$  be continuous,  
with  $f(x) = g(x) \quad \forall x \in A \cap B$ .

Then:  $h(x) = \begin{cases} f(x) & \text{if } x \in A \\ g(x) & \text{if } x \in B \end{cases} \quad \text{is } \underline{\underline{\text{continuous}}}$ .

Pf We'll use the "closed" version of continuity.

( $f$  is cts  $\Leftrightarrow$   $U$  closed  $\Rightarrow f^{-1}(U)$  closed)

Let  $C \subseteq Y$  be closed, will show  $h^{-1}(C)$  is closed in  $X$ .

Note that:  $h^{-1}(C) = f^{-1}(C) \cup g^{-1}(C)$

Since  $f$  is cts &  $C$  is closed,  $f^{-1}(C)$  is closed in  $A \subseteq X$ .

Also  $g$  is cts &  $C$  is closed,  $g^{-1}(C)$  is closed in  $B \subseteq X$ .

$f^{-1}(C)$  is closed in  $A$  means:  $f^{-1}(C) = D \cap A$  for  $D$  closed in  $X$ .

$g^{-1}(C)$  is closed in  $B$  means:  $g^{-1}(C) = E \cap B$  for  $E$  closed in  $X$ .

$$\text{So } h^{-1}(C) = (D \cap A) \cup (E \cap B)$$

$\begin{array}{ccccccc} & \uparrow & & \uparrow & & \uparrow & \\ & \text{closed in } X & & \text{closed in } X & & \text{closed in } X & \\ & \uparrow & & \uparrow & & \uparrow & \\ & \text{closed in } X & & \text{closed in } X & & \text{closed in } X & \end{array}$

$\therefore h^{-1}(C)$  is closed since it's a  $\cup$  &  $\cap$  of closed sets.

# Homeomorphisms

The basic idea of two top. spaces being "the same"

$X$  &  $Y$  are "the same" when

$\exists f: X \rightarrow Y$  such that.

- $f$  is a bijection  $\leftarrow$  (1-1 & onto)  
injective & surjective
- $f$  is continuous
- $f^{-1}$  is continuous

bijection & cts is not enough:

this is continuous &  
bijective, but  
not a homeomorphism

Def A function  $f: X \rightarrow Y$  is a homeomorphism if  
 $f$  is a bijection,  $f$  is continuous, and  $f^{-1}$  is  
continuous.

In this case we say  $X$  &  $Y$  are homeomorphic  
or topologically equivalent.

Simple examples:

Ex  $f(x) = 3x + 4$  is a homeo.

It's a bijection because it has an  
inverse function:

$$y = 3x + 4 \rightarrow x = \frac{y - 4}{3}$$

$$\text{so } f^{-1}(x) = \frac{x - 4}{3}$$

Both  $f$  &  $f^{-1}$  are continuous, so it's  
a homeo.

$f: \mathbb{R} \rightarrow \mathbb{R}$  so  $\mathbb{R}$  is homeo. to  $\mathbb{R}$

---

Any two open intervals are homeomorphic:

ex:  $(0, 1)$  is homeo. to  $(0, 4)$   
" " " " "  
" " " " "  
 $X$  " " " " "  $Y$

We need to create  $f: X \rightarrow Y$

$$f(x) = 4x$$

it's a bijection:  $f^{-1}(x) = \frac{1}{4}x$

Both are continuous.

Any two open intervals are top. equiv.  
 Also any two closed intervals are top. equiv.  
 Also any intervals  $[a, b)$  &  $[c, d)$   
 are top. equiv.

How about  $[a, b)$  vs  $(c, d]$

like  $[0, 1)$  vs  $(0, 1]$

Use

$$f(x) = 1 - x$$

this is a bijection,  $f$  &  $f^{-1}$  are cts.

So any half-open intervals will be homeomorphic.

What about  $[a, \infty)$  or  $(a, \infty)$   
 or  $\mathbb{R}$ ?
